# Pain Points

Primitive search

The documents cannot be searched by content. Is there a way, for example, to search for screenshots ?

Integration

There are other systems in your organization with which the new system must integrate seamlessly.

Sharing/Cataloging

Knowledge sharing and Cataloging of documents based on the needs of your teams

Objectives

- Institutional repository for all kinds of digital content

- Provide a powerful search

- Ease of sharing and cataloging

- Easy integration with other systems of your organization

Features – Intuitive search

- A very simple but powerful search box that can look for the entered keywords in title and the whole content of documents. This is powered by ElasticSearch!

- Advanced (meta) search supports narrowing down the search based on the custom fields that you created.

- Meta filters and full-text search combined together to further narrow down the results thus reducing the time for look-up to a great extent.

Features – Ease of sharing and integration

- Single Sign On is supported through SAML2 based configuration.

- The application can be integrated with other applications of your organization through APIs.

- Users don't have to open the application in their web browser. They just have to send an email with attachments to a pre-configured email address.

- A scheduled job fetches the emails and imports the attachments into the configured collection.

- Currently, connections over IMAP are supported.

Features – Optical Character Recognition

OCR

- If uploaded documents are images of type PNG or JPG, and they have legible English text, you can look for a part of the text.

- As the text gets indexed, you will be able to find the uploaded images by searching for text.

- Examples of such images are - screenshots taken for various different purposes. Screenshots may include error messages, payment confirmations, chats on various different platforms like whatsapp.

Features – Tracking Revisions

- Whenever a new version of a document is uploaded, a version is automatically created.

- Users can compare two versions of a document.

- Users can actually see what changed in a revision. A line-by-line comparison is made.

Features – Proofreading

- Feature available only to users that have "Edit Any" privilege

- Makes use of a service that highlights

  - Grammatical errors

  - Formatting issues

  - Spelling mistakes

  - And many more

Features – Web Resources (experimental)

- Collections may be created by crawling websites

- Authenticated crawling is supported

- Content of the linked documents is also indexed for better search results.

- This way, you can build a site-search for your websites.

Features – other

- No limits as regards to users or content

- Cloud storages can also be configured

- Documents can be made available after approval.

- Completely customizable
